

Load Analyzer

Description

Load Analyzer is a utility that analyzes a load library and determines the language of each member. For some COBOL dialects, Load Analyzer will identify key compiler and linkedit options in effect during compilation.

Reporting options provide the ability to sort the report either by program name or by language and to list the CSECTs contained in each load module.

Load Analyzer is included as part of the EMT, Enterprise Maintenance Tool, or may be licensed as a component of MHtran-2 or as a stand-alone product.
